

Understanding Type 1 Diabetes

You can develop type 1 diabetes at any age.

SYMPTOMS OF TYPE 1 DIABETES

Urinating often

Feeling very thirsty

Feeling very hungry—even though you are eating

Extreme fatigue

Blurry vision

Cuts/bruises that are slow to heal

Weight loss—even though you are eating more

Talk with your clinician about your risk for type 1 diabetes and if you should be tested.

Learning you have type 1 diabetes early lets you take steps early to stay healthy.

YOUR TYPE 1 DIABETES RISK

If you have a family history of type 1 diabetes your clinician can screen for type 1 diabetes through:

- Antibody testing
- Blood glucose monitoring

POSITIVE

If you test for antibodies

NEGATIVE

If you test antibody positive, you should expect to receive education about:

- Your risk of developing diabetes
- Diabetes symptoms
- Preventing diabetic ketoacidosis (DKA), a serious complication of high blood glucose that can be life-threatening.

Additional testing may be done to determine the course of treatment based on the stage of your diabetes.

Talk with your clinician about getting tested again in the future.

A positive antibody test does not mean immediate diagnosis. New treatments and clinical trials can possibly delay the onset of type 1 diabetes.

Talk with your clinician to determine if you are high risk for Type 1 diabetes.
